An anomalous temperature characteristic of electrical resistance and galvano-magnetic effect is detected in the region of -75°C for single crystal manganese ferrite which obviously is related to the existence of a low-temperature transition. It is determined that the electrical properties and the magnetic anisotropy for

The temperature dependence of the specific susceptibility and the magnetization of natural pyrrhotite specimens is investigated within the temperature range from room temperature to 600°C. The presence of thermal hysteresis of the magnetic properties at temperatures below the λ peak is confirmed. It is shown that the transformation in the region of the λ peak is diffusive in character and takes place isothermally. Rapid cooling leads to absence of a λ peak on the susceptibility-temperature curve and the magnetic properties of (Metallurgy--Ferrous Metals, TT, v. 5, no. 11) (over)
